Hi Yashwanth,

Thanks Nick, yes the command has changed, and this should work for you. Just wanted to point out that you can get a direct command that will work off the bat just by changing the aws ecr get-login command slightly by adding a flag.

```
aws ecr get-login --no-include-email
```

This should help remove any confusion, the resulting command you can copy-paste as Nick does in his course and you should be good to go.

You can find a discussion about this at <https://github.com/awslabs/amazon-ecr-credential-helper/issues/51> (<https://github.com/awslabs/amazon-ecr-credential-helper/issues/51>)

This is for people who are getting this response after copy-paste and execute of the response from the 'aws ecr get-login' command with no flags.

```
unknown shorthand flag: 'e' in -e
See 'docker login --help'.
```

Which can point you to some of the solution discussion and how AWS CLI reported issue was handled some time ago.
